

Resident Hosting: The pros and cons of each model

In this article, Part 2 of our Resident Hosting series we go into further detail about each model of resident hosting and the pros and cons of each model with them.

Resident hosting is a type of cloud hosting where the website is hosted on a server that is located in the same geographic location as the website's users. This is done to reduce latency and improve performance. Resident hosting is often used for applications that require high performance and low latency, such as video streaming and online gaming.

Resident Hosting: The pros and cons of each model
